## Introduction

---

### Overview

1. All inpatients are treated with the appropriate antimicrobial agent(s) to optimize clinical outcomes while minimizing unintended consequences of antimicrobial use.
  2. An Antimicrobial Stewardship program guides antimicrobial therapy for appropriate and efficient uses to improve/ optimize patient care.
- 

### Population

All employees, adult patients, and pediatric patients

---

## The Antimicrobial Stewardship Program

---

### Components

1. The antimicrobial stewardship program (ASP) will consist of two components: Hospital and Critical access hospitals (CAH) and ambulatory care facilities.
2. Hospitals and CAH facilities will have programs that consist of the following:
  - A. Expertise
    - a. Pharmacist trained in infectious diseases (ID) and/or
    - b. ID physician or physician with experience in antimicrobial stewardship (AMS)
  - B. The ASP should develop and implement clinical practices, collaborative practices, and treatment guidelines that are based on:
    - a. Evidence-based practice guidelines
    - b. Local microbiology and resistance patterns
    - c. De-escalation practices based on culture results (i.e., nares)
    - d. Optimization of dose based on individual patient characteristics, causative organism, site of infection, and drug characteristics
    - e. Parental to oral conversion as patient's condition allows
  - C. Computer surveillance and clinical decision support (CDS) should be employed
    - a. The computer-based system will provide prescribers alerts, recommendations, and capture data related to reason for antimicrobial use (e.g., indication)
    - b. CDS system will provide alerts to pharmacists to review therapy
  - D. Tracking and Monitoring

- a. Antimicrobial usage will be tracked and trended by days of therapy (DOT) per 1000 patient days to monitor use and identify opportunities for improved use
  - b. Antibiotic auditing (prospective or retrospective) may be utilized to monitor use and identify opportunities for improved use
  - c. Audits may be done to look at individual providers use or use by specialty to provide feedback and education
  - d. Criteria-based antimicrobials will be reviewed by pharmacists
  - e. Other data may be tracked and trended based on system or facilities needs
  - f. Antibiogram data will be reviewed annually
- E. Education is an essential element for influencing prescribing behaviors. Coupling education with active interventions, when possible, leads to the greatest effectiveness.
- F. A system AMS team will review system data to determine opportunities for improvement. In addition, the team will provide feedback and guidance for protocols, practices, and guidelines for the system to be rolled out at the facility level. The system team, at a minimum, should be comprised of the following:
- a. ID physician and/or a hospital epidemiologist
  - b. Clinical pharmacist
  - c. Clinical microbiologist
  - d. Infection preventionist
  - e. Information system specialist
- G. A system workgroup comprised of infectious disease pharmacists and clinical pharmacists will be responsible for identifying, designing, implementing, and monitoring strategies used to enhance the use of antimicrobials in an efficacious and cost-effective manner. The workgroup will help guide system work to promote appropriate selection and utilization of medications to optimize patient outcomes.
- H. Each facility will have their own AMS team which may be a subgroup of a larger team.
- a. Each facility AMS team should collect, analyze, and report their data to leadership and/or the facility Pharmacy and Therapeutic (P&T) Clinical Consensus Group (CCG).
  - b. In addition, the facility AMS team will provide the system ASP with recommendations or processes that may have system impact.

- I. Infection prevention (IP) will collaborate with the system AMS team. IP will provide updates to the system team regarding IP reports and any concerning trends being observed within the health system.
3. Ambulatory healthcare setting will have a program that consists of the following:
  - A. Support and expertise – An individual(s) will be identified to be accountable for ASP
  - B. One annual AMS goal should be set
  - C. Evidence based guidelines should be used in establishing an annual goal
  - D. Data will be collected, analyzed, and reported to the system AMS team and organizational leadership
  - E. Educational resources relating to the annual goal will be provided
  - F. A workgroup for the ambulatory healthcare setting will be established with membership from the following:
    - a. Pharmacy
    - b. Urgent Care Centers
    - c. Ambulatory Clinics
    - d. Emergency Departments

## **The Antimicrobial Stewardship Program**

---

**Management of the program**

The ASP is managed with the AMS plan. Components of the plan for hospitals and CAH are described in appendix A. Components of the plan for ambulatory healthcare setting are described in appendix B.
